child needs to be seen again if not improving in 10-14 days or sooner if their fever persists more than 72 hours, if not urinating every 6 hours, if vomiting or not tolerating fluids, having difficulty breathing, frequently waking at night or any concerns.

We recommend you see our website for more information on this topic by going the Medical Info tab then choose Infections then Common cold. The goals of treatment goals are to relieve your child's bothersome symptoms. The American Academy of Pediatrics does not recommend the use of cough and cold medications for children under 6 years of age as they can have serious and life threatening side effects. For your infant using 2-3 drops of nasal saline then gentle suctioning with bulb syringe or nasal aspirator such as NoseFrida prior to feeds or sleeping and as needed would be beneficial to clear secretions. You may also use a cool mist humidifier in their room. If your child is fussy and develops fever above 100.4, you can give acetaminophen (Tylenol) or if is well hydrated can give ibuprofen (Advil or Motrin). See website for medication dosing.

notes

URI over 5 - Your child was seen today and diagnosed with the common cold or upper respiratory infection. Your child needs to be seen again if not improving in 10-14 days or sooner if their fever persists more than 72 hours, if not urinating every 6 hours, if vomiting or not tolerating fluids, having difficulty breathing, frequently waking at night or any concerns.

We recommend you see our website for more information on this topic by going the Medical Info tab then choose Infections then Common cold. The goals of treatment goals are to relieve your child's bothersome symptoms. The American Academy of Pediatrics does not recommend the use of cough and cold medications for children under 6 years of age as they can have serious and life threatening side effects. For your infant using 2-3 drops of nasal saline then gentle suctioning with bulb syringe or nasal aspirator such as NoseFrida prior to feeds or sleeping and as needed would be beneficial to clear secretions. You may also use a cool mist humidifier in their room. If your child is fussy and develops fever above 100.4, you can give acetaminophen (Tylenol) or if is well hydrated can give ibuprofen (Advil or Motrin). See website for medication dosing.

notes

URI with asthma - Your child was seen today and diagnosed with the common cold or upper respiratory infection. Your child needs to be seen again if not improving in 10-14 days or sooner if their fever persists more than 72 hours, if not urinating every 6 hours, if vomiting or not tolerating fluids, having difficulty breathing, needing the rescue inhaler more frequently, frequently waking at night or any concerns.

We recommend you see our website for more information on this topic by going the Medical Info tab then choose Infections then Common cold. The goals of treatment goals are to relieve your child's bothersome symptoms. The American Academy of Pediatrics does not recommend the use of cough and cold medications for children under 6 years of age as they can have serious and life threatening side effects. For your infant using 2-3 drops of nasal saline then gentle suctioning with bulb syringe or nasal aspirator such as NoseFrida prior to feeds or sleeping and as needed would be beneficial to clear secretions. You may also use a cool mist humidifier in their room. If your child is less than 3 months old and develops a fever of 100.4 or more your child must be reevaluated. If your child is over 3 months old, is fussy and develops fever above 100.4, you can give acetaminophen (Tylenol) or if older than 6 months and is well hydrated can give ibuprofen (Advil). See website for medication dosing.

As your child has asthma it is important to follow the asthma action plan and give the rescue treatment (albuterol or xopenex) as discussed: we will need to re-evaluate if the need for more frequent treatments occurs or concerns arise.

notes

URI 2 - 5 - Your child was seen today and diagnosed with the common cold or upper respiratory infection. Your child needs to be seen again if not improving in 10-14 days or sooner if their fever persists more than 72 hours, if not urinating every 6 hours, if vomiting or not tolerating fluids, having difficulty breathing, frequently waking at night or any concerns.

We recommend you see our website for more information on this topic by going the Medical Info tab then choose Infections then Common cold. The goals of treatment goals are to relieve your child's bothersome symptoms. The American Academy of Pediatrics does not recommend the use of cough and cold medications for children under 6 years of age as they can have serious and life threatening side effects.
