D2C Plan Acne

 Discussed common triggers for acne including hormonal changes, and local skin changes

 Discussed skin care regimen in detail

 Discussed gentle skin care with organic unscented wash and lotion

 Gentle skin cleansers like Cetaphil skin cleanser can be used on a daily basis to gently lather and rinse the skin and then pat dry with a cotton cloth

 Reassured that acne is not caused by "dirty skin" and excessive face washing will worsen break outs

 Four main factors cause acne:
 Excess oil production.
 Hair follicles clogged by oil and dead skin cells.
 Bacteria.
 Excess activity of a type of hormone (androgens)

 Discussed the difference between open and closed comedones and how to prevent cystic acne; it is important not to try to "pop" pimples

 Discussed how sebum (oil) and clogged hair follicles can lead to debris collection in pores and then some strains of a bacteria called propionobacterium acnes lead to infection of those pimples

 Discussed some foods, chemicals and types of stress that may lead to acne flares

notes

- Treatment with benzoyl peroxide in the form of a cleanser or gel helps to reduce bacteria and reduce sebum production while also renewing new skin cell formation

notes

- Certain antibiotics may be used in combination with benzoyl peroxide either topically or orally to help reduce colonies of p. acne bacteria

notes

- Salicylic acid in small amounts helps with inflammation in the pores, but excessive use can lead to skin redness and peeling

notes

- Occasionally Retin-A products may be used to unblock pores and increase cell turnover

notes

- Gave instruction on how to use the medications and cleansers, gels

notes

- Discussed need for periodic visits to monitor acne

notes

- Consider Oral contraceptives to help manage acne that is worse due to menstrual cycle hormonal fluctuations

notes

- Referral to dermatology for further evaluation and treatment
