## D2C Plan Infant Rash

1000		2.1
Sel	ect	AII

Discussed common skin rashes and skin conditions in newborns and infants

pcc 03/03/2025 3:26PM Page 9 of 13

7	notes	*
	Discussed importance of gentle unscented skin care with organic coconut oil or organic shea butter based sk products	in
	notes	•
	Try to use dye-free and fragrance free laundry detergents for baby's clothes and crib bedding	
	notes	*
	Gave samples and coupons for unscented gentle skin care products for baby	
	notes	~
	Dry, peeling skin can be seen in almost all normal babies, but is especially noticeable in babies born a little late. The underlying skin is perfectly normal, soft, and moist	e.
	notes	•
	Erythema toxicum — also called erythema toxicum neonatorum (ETN) or toxic erythema of the newborn — is a common (not toxic) rash seen in full-term newborns. It usually appears in the first few days after birth and fac within a week.	
	notes	-
	These marks are flat and blue-gray. They typically appear on the buttocks or lower back, but may also be fount the arms or legs. They're generally present at birth or develop soon after.  These birthmarks are noncapperous and present no health danger. There's no recommended treatment for	d on

Occasionally, stork bites never go away.  notes  Pink pimples ('neonatal acne') are sometimes thought to be caused by exposure in the womb to maternal hormones. No treatment is needed, just time. They can last for weeks or even months on a baby's skin	ut their

pcc 03/03/2025 3:26PM Page 10 of 13

Seborrheic dermatitis is believed to be a combination of factors including genes, yeast that lives naturally on the skin, stress, chemical irritants and/or dry, cold weather that causes the skin to overproduce oil. In infants, it is triggered in part by hormones from the mother.					
notes	•				
Discussed neonatal pustular melanosis and appearance of pustules on skin on face, trunk, neck and extremities and reassured that the condition will resolve and is not dangerous and needs no specific treatment					
notes	•				
Discussed acrocyanosis and peripheral vascular changes that are common in babies and the bluish appearantingers and toes in the newborn period, also how it differs from central cyanosis	ice of				
notes	*				
Prickly heat looks like small red bumps, mostly on areas of your baby's body that tend to overheat and sweat, the neck, diaper area, and armpits. The treatment is to try to keep the area dry and avoid overheating by dress him in loose-fitting clothing					
notes	-				
A fungal infection(candidiasis) can show up in different ways on your baby. On the tongue, it is called thrush a looks like dried milk, which, unlike milk, cannot be scraped off. In the diaper area, candidiasis looks like an intered rash, often with smaller bumps around the edges. A fungal infection loves moist, dark areas, so you'll find redness due to it in the creases of the neck, underarms and groin (intertrigo). Candidiasis is treated with antiforal gel or liquid medicine (for oral thrush) or antifungal cream (for the diaper area), or both	ense				
notes	-				
Superficial hemangiomas, or cutaneous ("in-the-skin") hemangiomas, grow on the skin surface. They're also called strawberry hemangiomas or strawberry marks because of their bumpy red appearance.					
notes	-				
Deep hemangiomas grow under the skin, making it bulge, often with a blue or purple tint. Deep hemangiomas are also called subcutaneous ("under the skin") hemangiomas.					
notes	•				
Most infantile hemangiomas grow larger for several months, then shrink slowly. They usually grow the fastest within the first 3 months. Shrinking may start in the later part of the first year and continue until a child is age 7 or older. Infantile hemangiomas often shrink (or involute) to the point that they're no longer noticeable.					
notes	-				
Small red or purplish dots over the body ("petechiae") can be caused by a viral infection or a potentially very subacterial infection. These will not lighten with pressure. Any infant with possible petechiae should be evaluated a doctor immediately					
notes	*				
Fluid-filled blisters (especially ones with opaque, yellowish fluid) can indicate a serious infection, like a bacterial infection or herpes					
notes	•				
Follow up for any lack of improvement or worsening of rashes					
	-
